US-CL-CURRENT: 399/343

ABSTRACT:

Convexity-cleaning method and device for removing toner adhering to a convexity or convexities of an irregular surface of a non-fixing type image receiving sheet. When removing the toner, a contact surface of a cleaning member is brought into contact with the convexity or convexities, the irregular surface is moved relatively to the cleaning member at a first surface moving speed, the contact surface of the cleaning member is moved at a second surface moving speed, and a difference is made between the first and second surface moving speeds.

An image forming apparatus including a toner image forming device for forming a toner image both on an ordinary image receiving sheet and on a non-fixing type image receiving sheet; and a unit-fit part. Any one of a fixing unit and a convexity-cleaning unit can detachably fit to the unit-fit part, and thereby one of the fixing unit and the convexity-cleaning unit fitted to the unit-fit part can be exchanged to the other.

ABSTRACT:

Lee, Vincent

An imaging system that includes a photoreceptor belt capable of having an electrostatic latent image recorded thereon, a group of developing stations capable of developing a color image on the photoreceptor, and at least one charging means and at least one exposing means to prepare the photoreceptor for desired conditions, such as creating a cleaning patch to remove toner from a toner support member associated with one of the plurality of developing stations.

ABSTRACT:

An image forming apparatus includes an image bearing member; driving means for driving the image bearing member; latent image forming means for forming an electrostatic latent image on the image bearing member; developing means for developing the electrostatic latent image on the image bearing member with a developer; a cleaning member, contacted to the image bearing member, for cleaning a surface of the image bearing member; vibration imparting means for vibrating the cleaning member; control means for causing the latent image forming means to form an electrostatic latent image pattern for electrostatically attracting the developer deposited on the cleaning member and for causing the driving means to move the electrostatic latent image pattern to a contact portion where the cleaning member is contacted to the image bearing member.

US-CL-CURRENT: 399/411; 399/1, 399/343, 399/366, 399/71

ABSTRACT:

In a method and an apparatus for removing an image forming substance such as toner from an image holding member such as a sheet of transfer paper, an unstabilizing agent is provided to the image holding member. An attaching state between the image forming substance and the image holding member stably attaching the image forming substance on a surface thereof is changed to an unstable state by the unstabilizing agent. The image forming substance is separated and removed from the image holding member by making a separating member come in close contact with the image forming substance on the image holding member having the provided unstabilizing agent. A processing situation mark showing a processing situation of removal of the image forming substance is formed in the image holding member. The processing situation mark can be removed from the image holding member by the image forming substance removing processing.

ABSTRACT:

An image forming apparatus having at least: an image carrying member for carrying an electrostatic latent image, the image carrying member having a photosensitive layer on a conductive substrate; a developer for developing the electrostatic latent image carrying member on the image carrying member; a developer carrying member for carrying the developer and conveying it to a development area; a control member making contact with the developer carrying member for controlling the coating amount of the developer; and a cleaning member for cleaning the surface of the photosensitive layer of the image carrying member by making contact with the surface of the image carrying member with a contact pressure of 0.15N (15 gf) to 0.89N (90 gf). The photosensitive layer contains at least one kind of polycarbonate resin (I) having a viscosity average molecular weight of 1.5 times.10.sup.4 or less and at least one kind of polycarbonate resin (II) having a viscosity average molecular weight of more than 1.5 times.10.sup.4, the polycarbonate resin (I) is contained in 30% by mass to 95% by mass based on the total content of the resins (I) and (II). The developer has a toner containing toner particles and external additives, and the toner contains (a) 0.1% by mass to 5.0% by mass of a first fine powder with a number average particle size of 0.005 .mu.m to 3.00 .mu.m, and (b) 0.02% by mass to 2.00% by mass of an inorganic second fine powder containing 25% by mass to 90% by mass of a lubricant, as external additives.

ABSTRACT:

An image forming apparatus including an intermediate transfer member, an image forming device for forming a toner image on the intermediate transfer member wherein the toner image on the intermediate transfer member is transferred to a transfer material, a charging member for charging the intermediate transfer member by contacting the intermediate transfer member, wherein discharge is performed between the charging member and the intermediate transfer member by a voltage in which the direct current voltage and the alternating current voltage are superimposed applied to the charging member when the intermediate transfer member is charged by the charging member, and a control device for controlling the voltage applied to the charging member, wherein the control device stops the supply of the alternating current voltage to the charging member after the peak-to-peak voltage applied to the charging member is attenuated.

US-CL-CURRENT: 430/97; 399/343, 430/125

ABSTRACT:

A predetermined processing liquid is supplied by a liquid supplying unit to a sheet of transfer paper having a surface on which toner is stably attached. An adhesive state of the toner on the transfer paper sheet is changed to an unstable adhesive state. The processing liquid is constructed by water, aqueous solutions of a surfactant, a water-soluble polymer, etc. The transfer paper sheet including the processing liquid is fed to a toner separating unit. While the toner is heated and pressurized in the toner separating unit, the toner is attached to a separating roller having a surface on which the softened toner is easily attached. The toner separating unit then separates only the transfer paper sheet from the surface of the separating roller by a separating claw. The processing liquid is removed from the transfer paper sheet by heating the transfer paper sheet, etc. using a drying unit such that the transfer paper sheet can be reused for a copying machine, etc. Thereafter, the transfer paper sheet is discharged onto a paper discharging tray. Accordingly, it is possible to provide a

method and an apparatus for regenerating and reusing the transfer paper sheet by removing the toner therefrom without damaging paper fibers.

Okamoto; Jun	Tokyo		,	JP

US-CL-CURRENT: 399/343; 399/169, 399/350, 430/125

ABSTRACT:

The current methods and systems for <u>cleaning</u> residual ultra-fine spherical toner from an image forming surface discloses the application of aspherical toner to a <u>cleaning</u> blade. The aspherical toner is generally larger than the ultra-fine spherical toner which provides a superior image on an image-carrying medium. According to one preferred embodiment of the current invention, the aspherical black toner is placed in a predetermined area outside of a desired image area where the ultra-fine spherical toner in multiple colors is placed. The aspherical toner is transported to the <u>cleaning</u> blade before the multi-color toner reaches the <u>cleaning</u> blade. Since the aspherical toner applied at a contacting edge of the <u>cleaning</u> blade provide an effective seal or trap between the <u>cleaning</u> blade and the image forming surface, the ultra-fine spherical toner is effectively removed from the image forming surface.
